

MERIDIAN VALLEY DIAGNOSTICS — SYNTHETIC TEST DOCUMENT

Patient: TESTCASE, Alex (fictional) · DOB 1980-03-11 · Sex M · MRN SYN-000-114 · Collected 2026-02-14 · Reported 2026-02-16

Clinic note — internal medicine follow-up, 2026-02-20

Forty-six year old man seen for review of the February panel and the coronary CT. He reports three months of mid-afternoon fatigue, unchanged exercise tolerance, and no chest pain, dyspnoea or palpitations. Sleep averages six hours. Alcohol two units most evenings.

Medication: none regular. Supplements: creatine monohydrate 5 g daily, colecalciferol 1000 IU daily, started after the previous panel.

Examination unremarkable. BP 132/84 seated, repeat 128/80. BMI 27.4.

Discussed the calcium score and its progression at length, including what a percentile does and does not say about individual risk. Agreed to a twelve-week trial of dietary change and a stepped walking programme before revisiting lipid-lowering therapy, with a repeat lipid panel and ALT at the end of it. Advised reducing alcohol, which also bears on the transaminase.

Follow-up in twelve weeks, sooner for any exertional symptom.

Synthetic document generated for benchmarking. Not a real patient, not a real laboratory, not for clinical use.
